SDG 6 – Indicator 6.5.2 - Off-campus water conservation support

Water Conservation through Proper Utilization of River Water

Water conservation is an effort made to maintain and safeguard water resources so that they are always available both in quantity and quality. Utilising river water properly and protecting rivers from pollution are examples of actions in water conservation. To support this, Universitas Sriwijaya (UNSRI) through community service activities conducted an educational programme related to water and water filtration to the people of Pemulutan Ulu Village, Ogan Ilir Regency who live depending on the river in the area. The activity carried out by the UNSRI Community Service Team also aims to educate residents around the UNSRI campus related to water hygiene, types of water, how to treat dirty water polluted by waste to how to store water properly.
